

An ergonomic analysis of the flushing system in the design school toilets

By

Andrew Reece and Joe Alexander

Finding the flush

Sensor is in standardised position....

...but input and intended output are not inherently linked

Which is the flush?

Similar looking objects decreases signal to noise ratio

How to flush?

The written instructions should be unnecessary...

...and furthermore are unclear

Using the flush

The action towards the sensor is not clear

Will it flush

Small green flashing LED unavoidably obscured by use

It's not flushing!

The same action does not always have the same results

Any Questions?
